Research about alternative ways to measure the amount of hormones absorbed from a birth control pill

Study Involvement:

Participation will last up to 22 days and consist of three study visits. Participation will include taking one pack of birth control pills, containing both desogestrel and ethinyl estradiol. Participants will spend one day (8 hours) in clinic and receive an intravenous (IV) catheter for multiple blood draws. During that time, participants will have access to a TV and the internet to help pass the time. Blood will also be drawn on the final day of the study.

You may qualify if you:

• Are you a healthy female between the ages of 18-45?

• Are you willing and able to take a birth control pill containing desogestrel and ethinyl estradiol for three weeks?

Compensation will be provided (up to $220 for all study procedures)
